Medical Education in Pulmonary, Critical Care, and Sleep Medicine - Patricia A. Kritek
2019-05-14

This is a book for clinician educators. It offers modern, evidence-based practices to use in teaching learners at a range of levels, with an emphasis on concrete strategies that teachers can implement in their own clinical practices as well as in small and large group settings. Medical education is rapidly changing with emerging evidence on best practices and a proliferation of new technologies. As strategies for effectively teaching medical learners evolve, it is important to understand the implications for Pulmonary, Critical Care, and Sleep Medicine (PCCM). This text is structured to allow easy access to the reader. Chapters are organized around level of learner (e.g., medical student to PCCM fellow to practicing physicians) as well as the location of teaching. Given the variety of clinical settings in which PCCM physicians teach, specific consideration of best practices, broad changes in curricular design and pedagogy are considered in different clinical contexts. Each chapter begins with a focus on why the topic is important for clinician educators. A review of the available evidence and relevant medical education theory about the topic follows, with examples from specific studies that provide insight into best practices regarding the concepts and topics discussed in the chapter. For chapters focusing on learners, different environments are considered and similarly, if the focus is on the learning environment, attention is paid to the approach to different learners. Each chapter ends with a summary of the primary points from the chapter and concrete examples of how clinician teachers can put the concepts discussed in the chapter into practice. This is an ideal guide for educators in pulmonary, critical care, and sleep medicine.

The Engines of Hippocrates - Barry Robson
2009-05-27

A unique, integrative look at information-based medicine The convergence of medical science, biology, pharmacology, biomedical engineering, healthcare, and information technology is revolutionizing medical and scientific practice, and has broader social implications still being understood. The Engines of Hippocrates provides a unique, integrative, and holistic look at the new paradigm of information-based medicine, covering a broad range of topics for a wide readership. The authors take a comprehensive approach, examining the prehistory, history, and future of medicine and medical technology and its relation to information; how history led to such present-day discoveries as the structure of DNA, the human genome, and the discipline of bioinformatics; and what the future results of these discoveries may hold. Their far-ranging views are their own and not necessarily those of the IBM Corporation or other employers. The Engines of Hippocrates helps readers understand: Forces shaping the pharmaceutical and biomedical industries today, including personalized medicine, genomics, data mining, and bionanotechnology The relationship between pharmaceutical science today and other disciplines such as philosophy of health, history, economics, mathematics, and computer science The integrated role alternative and non-Western medicines could play in a new, information-

based medicine Practical, ethical, organizational, technological, and social problems of information-based medicine, along with a novel data-centric computing model and a self-adaptive software engineering model, and corresponding information technology architectures, including perspectives on sharing remote data efficiently and securely for the common good An unmatched, cross-disciplinary perspective on the big picture of today and tomorrow's medicine, *The Engines of Hippocrates* provides a reference to interested readers both inside and outside the pharmaceutical and medical communities, as well as a peerless classroom supplement to students in a wide variety of disciplines.

Fluid Resuscitation - Institute of Medicine 1999-10-05

Historically, 20% of all injured combatants die on the battlefield before they can be evacuated to a field hospital. Blood loss--hemorrhage--is the single major cause of death among those killed in action whose lives might otherwise be saved. Fluid resuscitation and the treatment of hypovolemia (the abnormally decreased volume of circulating fluid in the body) offer the greatest opportunity for reducing mortality and morbidity associated with battlefield casualties. In *Fluid Resuscitation*, a committee of experts assess current resuscitation fluids and protocols for the treatment of combat casualties and make recommendations for future research. Chapters focus on the pathophysiology of acute hemorrhagic shock, experience with and complications of fluid resuscitation, novel approaches to the treatment of shock, protocols of care at the site of injury, and future directions for research. The committee explicitly describes the similarities and differences between acute medical care during combat and civilian emergency trauma care. *Fluid Resuscitation* should help energize and focus research in both civilian and military emergency care and help save the lives of citizens and soldiers alike.

A First Course in Systems Biology - Eberhard O. Voit 2012-03-28

A First Course in Systems Biology is a textbook designed for advanced undergraduate and graduate students. Its main focus is the development of computational models and their applications to diverse biological systems. Because the biological sciences have become so complex that no individual can acquire complete knowledge in any given area of specialization, the education of future systems biologists must instead develop a student's ability to retrieve, reformat, merge, and interpret complex biological information. This book provides the

reader with the background and mastery of methods to execute standard systems biology tasks, understand the modern literature, and launch into specialized courses or projects that address biological questions using theoretical and computational means. The format is a

combination of instructional text and references to primary literature, complemented by sets of small-scale exercises that enable hands-on experience, and larger-scale, often open-ended questions for further reflection.
