Best Practice Membangun DataCenter - Ruang Server untuk Perusahaan, Governmen dan UKM - Nathan Gusti Ryan 2018-08-29

Perkembangan teknologi informasi tidak bisa dipisahkan dari perkembangan teknologi dan infrastruktur server. Sedangkan infrastruktur Server System sendiri tidak lepas dari Standart

DataCenter yang layak, memadai serta mengacu kepada standarisasi DataCenter Internasional. Banyak orang yang menganggap bahwa membangun DataCenter atau membangun Ruang server itu mudah. Namun pada kenyataannya masih banyak yang SALAH dalam membangun DataCenter mereka karena umumnya mereka hanya berbekal Googling saja tanpa memahami standart DataCenter yang sebenarnya. Bahkan ada salah satu DataCenter pemerintahan yang mana mereka klaim sebagai DataCenter yang terbaik dilingkungan pemerintah se-propinsi. Betul. DataCenter ini merupakan DataCenter yang terbaik di propinsi tersebut. Namun... masih banyak standart DataCenter yang tidak diterapkan, bahkan instalasi AC saja masih salah... Wow.... Standart DataCenter yang diterapkan dalam buku ini mengacu pada standart ANSI / BICSI-002-2011. Tujuan utama dari ANSI/BICSI-002-2011 adalah sebagai standarisasi persyaratan instalasi Data Center dan sebagai panduan / pedoman implementasi desain DataCenter tersebut. Penggunaan Standar ANSI/BICSI-002-2011 adalah sebagai pendamping atau sinergi dalam hubungannya dengan standar infrastruktur telekomunikasi yang sudah ada. Seperti : - ANSI/TIA-942 - AS / NZS 2834-1995 Komputer Akomodasi - CENELEC EN 50173 Seri - CENELEC EN 50174 Seri - ISO / IEC 24764... - dll Buku ini merupakan pemahaman dan pengalaman penulis dalam membangun berbagai DataCenter untuk perusahaan, untuk lingkup pemerintahan maupun untuk kepentingan personal bahkan Private & Secret DataCenter. Penulisan dalam buku ini dibuat semudah mungkin untuk dipahami oleh orang awam sekalipun sehingga semakin paham dan mampu membangun DataCenter / Ruang server sendiri setelah membaca buku ini.

IEEE Recommended Practice for Grounding of Industrial and Commercial Power Systems - IEEE Industry Applications Society. Power Systems Engineering Committee 1992

The problems of system grounding, that is, connection to ground of neutral, of the corner of the delta, or of the midtap of one phase, are covered. The advantages and disadvantages of grounded versus ungrounded systems are discussed. Information is given on how to ground the system, where the system should be grounded, and how to select equipment for the grounding of the neutral circuits. Connecting the frames and enclosures of electric apparatus, such as motors, switchgear, transformers, buses, cables conduits, building frames, and portable equipment, to a ground system is addressed. The fundamentals of making the interconnection or ground-conductor system between electric equipment and the ground rods, water pipes, etc. are outlined. The problems of static electricity (how it is generated, what processes may produce it, how it is measured, and what should be done to prevent its generation or to drain the static charges to earth to prevent sparking) are treated. Methods of protecting

structures against the effects of lightning are also covered. Obtaining a low-resistance connection to the earth, use of ground rods, connections to water pipes, etc, are discussed. A separate chapter on sensitive electronic equipment is included.

Advanced Concepts for Renewable Energy Supply of Data Centres - Jaume Salom 2022-09-01

The rapid increase of cloud computing, high performance computing (HPC) and the vast growth in Internet and Social Media use have aroused the interest in energy consumption and the carbon footprint of Data Centres. Data Centres primarily contain electronic equipment used for data processing (servers), data storage (storage equipment), and communications (network equipment). Collectively, this equipment processes, stores, and transmits digital information and is known as information technology (IT) equipment. Advanced Concepts for Renewable Energy Supply of Data Centres introduces a number of technical solutions for the supply of power and cooling energy into Data Centres with enhanced utilisation of renewable energy sources in order to achieve low energy Data Centres. Because of the high energy density nature of these unique infrastructures, it is essential to implement energy efficiency measures and reduce consumption before introducing any renewable energy source. A holistic approach is used with the objective of integrating many technical

solutions such as management of the IT (Information Technology) load, efficient electrical supply to the IT systems, Low-Ex air-conditioning systems, interaction with district heating and cooling networks, re-use of heat, free cooling (air, seawater, groundwater), optimal use of heat and cold storage, electrical storage and integration in smart grids. This book is therefore a catalogue of advanced technical concepts that could be integrated into Data Centres portfolio in order to increase the overall efficiency and the share of renewable energies in power and cooling supply. Based on dynamic energy models implemented in TRNSYS some concepts are deeply evaluated through yearly simulations. The results of the simulation are illustrated with Sankey charts, where the energy flows per year within the subsystems of each concept for a selected scenario are shown, and graphs showing the results of parametric analysis. A set of environmental metrics (as the non-renewable primary energy) and financial metrics (CAPEX and OPEX) as well of energy efficiency metrics like the well-known PUE, are described and used to evaluate the different technical concepts.

The forces of globalization on one hand and rapidly growing marketing opportunities overseas, especially in emerging economies on the other, have led to the expansion of operations on a global scale. The book aims to cover the main topics characterizing operations management including both strategic issues and practical applications.
