A Child's Eyes - John Willard Simon 1998

HEALTH This book by two academic ophthalmologists specializing in pediatric ophthalmology is aimed at an important and unique dual readership: parents and nonophthalmologist physicians, pediatricians, and family practice specialists. The text describes in detail the specific tests of visual function most often used in diagnosing children's eye conditions. Also covered are the full range of common eye problems as well as many rarely occurring diseases or conditions. The writing is straightforward but not overly simplified, and the illustrations are an appropriate mix of photographs and sketches. The only weak point is the book's coverage of genetic eye diseases: for example, Leber's congenital amaurosis is given two paragraphs, while Usher syndrome and juvenile retinoschisis are not mentioned. Collections with frequent queries concerning genetic diseases may want to supplement this text with Saul Merin's *Inherited Eye Diseases* (Dekker, 1991). Still, this volume is highly recommended for all public and hospital patient education collections.

Google Me - Barbara Cassin 2017-10-03

"Google is a champion of cultural democracy, but without culture and without democracy." In this witty and polemical critique the philosopher Barbara Cassin takes aim at Google and our culture of big data. Enlisting her formidable knowledge of the rhetorical tradition, Cassin demolishes the Google myth of a "good" tech company and its "democracy of clicks," laying bare the philosophical poverty and political naiveté that underwrites its founding slogans: "Organize the world's information," and "Don't be evil." For Cassin, this conjunction of globalizing knowledge and moral imperative is frighteningly similar to the way American demagogues justify their own universalizing mission before the world. While sensitive to the possibilities of technology and to Google's playful appeal, Cassin shows what is lost when a narrow worship of information becomes dogma, such that research comes to mean data mining and other languages become provincial "flavors" folded into an impoverished Globish, or global English.

Ophthalmic Dictionary and Vocabulary Builder for Eye Care Professionals - Harold A Stein 2012-12-15

The Vocabulary Builder is a unique, creative and original book. It organizes words into chapters by sectors and provides origins of ophthalmic words for easy recall and interesting reading. The fourth edition of this Dictionary is well illustrated and written with easy to understand definitions. The book is oriented for fast delivery of meaning and definitions, with the emphasis on simplicity and practicality. It is definitely not a reference tome to give impressive weight to an ophthalmic word and syndrome in a costly compendium. We have prepared a practical book whose function, at the bottom line, is to assist in communication and to help develop vocabulary. A new chapter on refractive surgery has been added to this rapidly expanding subspecialty. Imaging words such as OCT have been added. This ophthalmic dictionary is useful for ophthalmologist and ophthalmic Assistant.

Medical Image Analysis and Informatics - Paulo Mazzoncini de Azevedo-Marques 2017-11-23

With the development of rapidly increasing medical imaging modalities and their applications, the need for computers and computing in image

generation, processing, visualization, archival, transmission, modeling, and analysis has grown substantially. Computers are being integrated into almost every medical imaging system. Medical Image Analysis and Informatics demonstrates how quantitative analysis becomes possible by the application of computational procedures to medical images. Furthermore, it shows how quantitative and objective analysis facilitated by medical image informatics, CBIR, and CAD could lead to improved diagnosis by physicians. Whereas CAD has become a part of the clinical workflow in the detection of breast cancer with mammograms, it is not yet established in other applications. CBIR is an alternative and complementary approach for image retrieval based on measures derived from images, which could also facilitate CAD. This book shows how digital image processing techniques can assist in quantitative analysis of medical images, how pattern recognition and classification techniques can facilitate CAD, and how CAD systems can assist in achieving efficient diagnosis, in designing optimal treatment protocols, in analyzing the effects of or response to treatment, and in clinical management of various conditions. The book affirms that medical imaging, medical image analysis, medical image informatics, CBIR, and CAD are proven as well as essential techniques for health care.

Clinical Neurotherapy - John K. Nash 2013-10-18
This chapter provides a brief introduction to neurofeedback as practiced by the author, followed by a rather detailed description of vision therapy, which he has found to be an excellent supplement, especially with many cases of attention deficit hyperactivity disorder and traumatic brain injury. The chapter provides basic information about the problems created by impaired control of binocular eye movement, and the use of orthoptic vision therapy to correct functional visual problems such as poor convergence and divergence. Poor binocular control creates problems such as headaches, slowed and inaccurate reading and poor depth perception. Poor depth perception in turn leads to poor sports performance and a self-perception of being "clumsy." Combining challenging and activating tasks, including active listening and vision therapy methods, with neurofeedback during a course of neurotherapy is also addressed, as is how and when to refer to a developmental/behavioral vision specialist (orthoptist).

Photographical Analysis of Macro- and Micro-aesthetic Appearance. A Cross-Sectional Study of Iraqi Adults with Class I Normal Occlusion - Dana R. Mohammed 2018-01-23

The first sign of facial beauty was displayed in Egyptian civilization art works as they started to understand the divine or golden proportion that was known as a golden ratio which could be defined as the ratio that considered to be the most aesthetically pleasing to the human's eye and the base of countless mysteries over centuries. In the past, the cephalometric analysis represented an important tool in planning an orthodontic treatment, but today, the focus is mainly on the facial soft tissue and the dental assessment by using photographs. Despite most of the orthodontists are focused primarily on the occlusal discrepancies and mal-relations when discussing the needs of orthodontic treatment with the patients, and the patients and parents are focused mainly on the appearance, the orthodontic diagnosis and treatment planning should have a broader extent, include the occlusion, tooth shape and appearance of the face to have both excellent occlusion and excellent aesthetics, although this is quite difficult, but it is the goal that all orthodontists should pursue. This book represents a master thesis in orthodontics from the College of Dentistry-University of Baghdad/Iraq. The uniqueness of this work comes from that it is the first one that analyses the micro-aesthetic appearance to establish normative values for the Iraqi population and find out whether there is a correlation between apparent mesiodistal measurements of maxillary anterior teeth and facial measurements by an indirect method of measurement, using photographs in a sample of Iraqi population.
