Pruning and Population Adjustment in Relation to Fruit Trees Productivity - Mohamed Saleh 2011-08-03

Project Report from the year 2002 in the subject Agrarian Studies, National Research Center - Agricultural and Biological Research Division (-), language: English, abstract: High planting density is considered one of the modern management systems in new fruit orchards. Pruning and population adjustment are some of the main way to approach high productivity and good fruit quality under the modern management systems. Pruning is defined as the management of plant structure and fruiting wood and it is considered one of the main factors affecting fruit trees production. There are many objectives for pruning i.e. controlling the direction of growth, developing a strong framework, controlling the amount of growth, improved productiveness, improving quality product, utilizing space efficiently and increasing the usefulness of plant. There are three main systems of fruit trees training (i) Central leader system, (ii) Modified leader system, (iii) Open center or vase system. Also there are several kinds of pruning i.e. heading back and thinning out, fine and coarse pruning and root pruning. However, it is important to select the suitable training system and kind of pruning according to the target of the pruning to reach optimum vegetative growth and maximum yield with high fruit quality. On the other hand, population adjustment (plant

distribution or planting density) is very important factor affecting fruit trees production. We can reach the optimum usefulness of the planted area by using best population adjustment of trees in the plantation. Trees can be planted using different systems:- triangle, rectangle, square system.....etc. On the other side, presence of pollinator trees through the orchard is very important for many fruit trees. Pollinator can be planted either in (1) Complete along rows, as one row of pollinator per two or four rows of the main cultivar. (2) The second tree in the second row. (3) The third tree in the third row. (4) Across rows through the orchard. On the other hand, good plant distribution is very helpful for mechanical serves in the plantation, We can say that the key objective in planning a new orchard should be to maximize yield in the early years and still effectively produce larger yield of high quality fruits in the next years. This may be happened by utilizing space efficiently and increasing the usefulness of plant using the suitable training system, kind of pruning, also good population adjustment of the trees in the orchard beside the importance of the other factors affecting production process.

How to Prune an Apple Tree - Chloe Ward 2014-09-09

The subject of fruit pruning can cause much confusion, and the technical terminology and perfect looking trees in the pruning manuals can sometimes be demoralising. This guide avoids jargon, but explains pruning by illustrating how an apple tree grows and how it responds to being pruned. It covers all aspects of apple tree pruning, from forming

the shape of a newly planted tree, to restoring an old tree, the reasons for winter and summer pruning, and what tools to use. The author's experience with fruit growing is in the UK, but the principles should apply to apple (and pear) trees growing in anywhere in a temperate climate.

Preharvest Modulation of Postharvest Fruit and Vegetable Quality is the first book to focus on the potential yield quality, quantity and safety benefits of intervention during growth. Of the many factors responsible for overall quality of produce, about 70 percent comes from pre-harvest conditions. Written by an international team of experts, this book presents the key opportunities and challenges of pre-harvest interventions. From selecting the most appropriate growing scenario, to treating plants during the maturation process, to evaluating for quality factors to determine appropriate interventions, this book provides an integrated look at maximizing crop yield through preventative means. In fact, with the very best of postharvest knowledge and technologies available, the best that can be achieved is a reduction in the rate at which products deteriorate as they progress through their normal developmental pattern of maturation, ripening and senescence. That and Fern Publishing. Together they've gone over and over her writing. Every word has been weighed up. Order and structure and tense challenged. They've walked the line between tidying up her terrible grammar, and retaining her quirky ways. *Pruning Fruit Trees* has been a big extra to life. The house is super dusty and please don't look in the oven, but it's been worth it. Her focus is on helping beginners, but she also hopes to give experienced pruners new eyes for trees. Calm trees is her overall aim. A less is more approach to cutting with a focus on training as well as pruning. This doesn't mean wild, woolly things that need ladders compact and productive are my guiding lights.

Pruning and Training Fruit Trees - Warren Somerville 1996

The viability of modern fruit production is dependent on a number of factors. Probably the most important one of these after site selection is that of orchard design. The selection of suitable cultivator and rootstock combinations is the starting point for ongoing tree training and pruning which will continue for the life of the orchard. The days of large size fruit trees producing a tonne or more of each fruit are gone forever - a modern orchardist cannot afford to wait for the trees to grow very large, and the production costs of fruit on large, old trees is very high.
