**Fundamentals of Air Pollution** - Daniel A. Vallero 2008

Fundamentals of Air Pollution is an important and widely used textbook in the environmental science and engineering community. Written shortly after the passage of the seminal Clean Air Act Amendments of 1990, the third edition was quite timely. Surprisingly, the text has remained relevant for university professors, engineers, scientists, policy makers and students up to recent years. However, in light of the transition in the last five years from predominantly technology-based standards (maximum achievable control technologies or MACTs) to risk-based regulations and air quality standards, the text must be updated significantly. The fourth edition will be updated to include numerous MACTs which were not foreseen during the writing of the third edition, such as secondary lead (Pb) smelting, petroleum refining, aerospace manufacturing, marine vessel loading, ship building, printing and publishing, elastomer production, offsite waste operations, and polyethylene terephthalate polymer and styrene-based thermoplastic polymers production. Overall, revisions will reflect the numerous changes in the understanding of air pollution and the development of new technologies that has occurred in the past twelve years. \* Focuses on the process of risk assessment, management and

communication, the key to the study of air pollution. \* Provides the latest information on the technological breakthroughs in environmental engineering since last edition \* Updated information on computational and diagnostic and operational tools that have emerged in recent years.

**Environmental Toxicology** - Ming-Ho Yu  
2000-06-27

How are pollutants transformed after their release into the environment? How are organisms exposed, and how do physiological alterations impact population dynamics and community structure? What direct or indirect impacts occur? As early as the 50s and 60s people living near industrial plants began to recognize undesirable changes in their environment - and to ask these very questions. The discipline of environmental toxicology addresses these questions. Written by an expert with over twenty years experience, Environmental Toxicology covers the physiological and toxicological effects of environmental toxicants on living systems. It explores the sources, and the physical and chemical characteristics of toxicants. It goes further to highlight their impact on plants, animals, and humans. The author furnishes information on the mechanism of action of individual chemicals and chemical combinations including cellular damage at the molecular level. He defines environmental toxicology and discusses the relationship between human activities and their impacts on living systems. He furnishes an overview of our changing environment and the possible link between that environment and the changing pattern of human diseases. Environmental Toxicology provides fundamental knowledge on the toxicological effects of environmental chemicals on living systems. Its fifteen chapters cover the occurrence of toxicants, air pollution, environmental metals, pesticides and related materials such as PCBs and dioxins, mutagenesis, and environmental cancer. This useful resource will enhance your knowledge of the impacts of environmental toxicants on living organisms.
