Feline Clinical Parasitology - Dwight D. Bowman 2008-02-08

Although there are books available dealing with canine parasitology, there is at present no book detailing parasites that offers clinical information specific to felines. Cats differ significantly from dogs in their parasitic infections and infestations. Although dogs and cats do share a few parasites, the vast majority of the parasites of these pets are specific to either cats or dogs, not to both. This must-have reference offers an in-

depth examination of feline parasites. Topics covered include parasite identification, history, geographic distribution, pathogenesis, epidemiology, zoonosis, diagnosis, treatment, control, and prevention. Because of the immense worldwide popularity of cats and due to the amount of travel undertaken by cats and their owners, the authors have produced a book that is international in scope. Consequently, this exhaustive reference has strong appeal to practitioners and veterinary parasitologists in North America and around the world.

Management of Severe Malnutrition - World Health Organization 1999-01-01

This manual provides expert practical guidelines for the management of severely malnourished children. Addressed to doctors and other senior health workers, the manual explains exactly what must be done to save lives, achieve successful management and rehabilitation, prevent relapse, and thus give these children the greatest chance of full recovery. Throughout, the importance of treating severe malnutrition as both a medical and a social disorder is repeatedly emphasized. As successful management does not require sophisticated facilities and equipment or highly qualified personnel, the manual also performs a persuasive function, encouraging health professionals to do all they can to save these children and meet their great need for care and affection. Recommended procedures draw on extensive practical experience as well as several recent therapeutic advances. These include improved solutions of oral rehydration salts for the treatment of dehydration, better understanding of the role of micronutrients in dietary management, and growing evidence that physical and psychological stimulation can help prevent long-term consequences of impaired growth and psychological development. Noting that the physiology of malnourished children is seriously abnormal, the manual gives particular attention to aspects of management - whether involving the interpretation of symptoms or the use of specific interventions - that differ considerably from standard procedures for well-nourished children. Details range from the reasons why IV infusion easily causes overhydration and heart failure, through a list of treatments that have no value and should never be used, to the simple reminder that underarm temperature is not a reliable guide to body temperature in a malnourished child during rewarming. Further practical guidance is provided in eight appendices, which use numerous tables, charts, sample recording forms, instructions for preparing feeds, and examples of easily constructed toys to help ensure that management is thorough, safe, and in line with the latest knowledge.
